Vapormatic Air Conditioning Service Stations – (Part No. VPM8850)

To comply with the safety and environmental regulations which are leading to lower systems refrigerant volumes, vehicle systems now require more accurate refrigerant and lubricant recharging. TEXA professional A/C service equipment KONFORT 650E 09 has been developed to operate efficiently on all modern A/C systems with respect to vehicle manufacturers recommendations and modern technicians expectations.

The KONFORT 650E 09 gives the operator the choice between an automatic operating mode or a programmable operating mode: The automatic mode uses a vehicle database that includes the refrigerant charging data and compressor oil specs for many of the vehicles available in Europe today. Oil and UV tracer are automatically controlled by three electronic high precision scales.

The inbuilt database can be periodically updated as new vehicle models are released into the market. The programmable mode allows selection of an individual operating phase and gives the user the freedom to customise each of the parameters, to set a specific configuration to meet vehicle requirements.
